

The Fergus Veterinary Hospital's concern for your pet starts before your visit, and our partnership continues 24/7 thereafter.

During appointments it is easy for the questions you may have to get missed. Also information you have, that maybe important for the health management of your pet is better collected before the visit. Please fill in the following questionnaire to aid us in keeping your pet healthy. Then print off and bring with you or better just email it to we-help-pets@fergusvet.com before your visit.

They play and exercise on own (yes) (no)

or How many minutes and how many times a week are they active?_____

They spend how much time outside? Never () Rarely () Daily () All or almost all the time ()

Mapping Concerns: Please use the silhouette to the left to map any lumps, bumps, hair or skin issues that you may have questions about.

Your pet's welfare by the numbers. There are 3 very common health problems or diseases that tend to get ignored because they are common and they slowly cause pain and shorten life. We all want long comfortable lives for our pets.

1) Weight and nutrition. 60% + pets are overweight. Longer and more comfortable lives result from being at the optimal weight. Also obesity is an inflammatory disease.

Do you want help with weight and nutrition? Yes () No ()

2) Oral infections and teeth disease will affect 85%+ of pets. Injuries and infection to teeth and gums cause pain and chronic inflammation.

Do you want help preventing oral disease? Yes () No ()

3) Arthritis will affect between 25 and 95% of pets depending on age. Arthritis is an inflammatory disease and commonly leads to chronic- maladaptive pain states. Chronic inflammatory diseases are a major trigger of cancer.

Do you want help mitigating or slowing arthritis? Yes () No ()

Remember only humans and animal actors in Disney movies whine and complain when in pain and get rewarded for it. Regular real world animals are genetically and behaviorally programmed to hide pain. (just like a hockey player) Translating a pet's message of pain into human language is one of our goals.

Please bring a urine and or fecal sample if there is a question about urine or stool quality or a desire to screen for hidden health problems. A stool sample is required for microscope analysis to determine if worm eggs and hence worms are present, especially worms that can infect people. Urine needs chemical and microscopic testing to confirm it is normal.

To make visits stress-free have them arrive hungry. Combining treats with skin numbing cream and most patients do not notice even needles.

If your pet is especially nervous contact us in advance for methods to reduce their anxiety. Patient care at the dentist, doctor or veterinarian should not cause fear.
